

Vascepa Prior Authorization with Quantity Limit Program Summary

This program applies to Medicaid.

POLICY REVIEW CYCLE

Effective Date
04-01-2024

Date of Origin
07-01-2019

FDA APPROVED INDICATIONS AND DOSAGE

Agent(s)	FDA Indication(s)	Notes	Ref#
Vascepa® (icosapent ethyl)* Capsule	<p>Adjunct to maximally tolerated statin therapy to reduce the risk of myocardial infarction, stroke, coronary revascularization, and unstable angina requiring hospitalization in adult patients with elevated triglyceride (TG) levels (greater than or equal to 150 mg/dL) and</p> <ul style="list-style-type: none"> Established cardiovascular disease or Diabetes mellitus and 2 or more additional risk factors for cardiovascular disease <p>Adjunct to diet to reduce triglyceride (TG) levels in adult patients with severe (greater than or equal to 500 mg/dL) hypertriglyceridemia.</p> <p>Limitations of Use: the effect of Vascepa on the risk for pancreatitis in patients with severe hypertriglyceridemia has not been determined.</p>	*generic available	1

See package insert for FDA prescribing information: <https://dailymed.nlm.nih.gov/dailymed/index.cfm>

CLINICAL RATIONALE

Efficacy	<p>Vascepa was studied in the REDUCE-IT phase 3b multinational, randomized, double blind, placebo-controlled trial comparing icosapent ethyl (4 grams daily) to placebo in 8,179 adult patients. REDUCE-IT enrolled men or women at least 45 years of age with established cardiovascular disease (71%) or at least 50 years of age with diabetes mellitus and one additional risk factor (29%). Randomization required fasting triglycerides (TG) of at least 150 mg/dL to 499 mg/dL and LDL-C of 41 mg/dL to 100 mg/dL with a stable statin (for at least 4 weeks prior to qualifying measurements).(1,3) Due to the intraindividual variability of TG levels, the initial protocol allowed for a 10% lower TG level from the target lower limit, which permitted patients to be enrolled if they had a TG level of at least 135 mg/dL.(2) Patients with established cardiovascular disease (CVD) had a documented history of coronary artery disease, cerebrovascular or carotid disease, or peripheral artery disease.(1,3) Risk factors for CVD in the second group of patients included:(3)</p> <ul style="list-style-type: none"> Men at least 55 year of age and women at least 65 years of age Cigarette smoker or stopped smoking within 3 months Hypertension (greater than or equal to 140 mm Hg systolic or greater than or equal to 90 mm Hg diastolic) or on antihypertensive medication HDL-C less than or equal to 40 mg/dL for men or less than or equal to 50 mg/dL for women High-sensitivity C-reactive protein (hsCRP) greater than 3.00 mg/L Renal dysfunction (CrCl greater than 30 and less than 60 mL/min) Retinopathy defined as any of the following: nonproliferative retinopathy, preproliferative retinopathy, proliferative retinopathy, maculopathy, advanced diabetic eye disease, or a history of photocoagulation Micro- or macroalbuminuria
----------	--

	<ul style="list-style-type: none"> An ankle-brachial index (ABI) of less than 0.9 without symptoms of intermittent claudication <p>The primary efficacy endpoint was a composite of CV death, nonfatal myocardial infarction (MI) (including silent MI), nonfatal stroke, coronary revascularization, or unstable angina in a time-to-event analysis. The key secondary endpoint is a composite of CV death, nonfatal MI, or nonfatal stroke in a time-to-event analysis. Additional individual or composite endpoints include: composite of CV death or nonfatal MI; fatal or nonfatal MI; emergency or urgent coronary revascularization; CV death; hospitalization for unstable angina; fatal or nonfatal stroke; a composite of death from any cause, nonfatal MI, or nonfatal stroke; and death from any cause. A primary end-point event occurred in 17.2% of the patients in the icosapent ethyl group, as compared with 22.0% of the patients in the placebo group (hazard ratio, 0.75; 95% confidence interval [CI], 0.68 to 0.83; P less than 0.001). The corresponding rates of the key secondary endpoint were 11.2% and 14.8% (hazard ratio, 0.74; 95% CI, 0.65 to 0.83; P less than 0.001). The rates of additional ischemic end points, as assessed according to a prespecified hierarchical schema, were significantly lower in the icosapent ethyl group than in the placebo group, including the rate of fatal or non-fatal MI (6.1% vs. 8.7%), emergency or urgent coronary revascularization (5.3% vs. 7.8%), cardiovascular death (4.3% vs. 5.2%), hospitalization for unstable angina (2.6% vs. 3.8%), and fatal or nonfatal stroke (2.4% vs. 3.3%).(1)</p> <p>The American Heart Association (AHA) released an advisory statement identifying icosapent ethyl is the first non-LDL-focused lipid therapy to demonstrate CV benefit and should be considered first-line therapy for patients with diabetes mellitus type 2 and coronary artery disease whose TG remain elevated (>135 mg/dL) despite maximally tolerated statin and lifestyle changes.(5)</p> <p>The American Diabetes Association (ADA) gives icosapent ethyl an "A" level recommendation in patients with atherosclerotic CVD or other CV risk factors on a statin with controlled LDL-C but elevated triglycerides (135–499 mg/dL) noting the addition of icosapent ethyl can be considered to reduce CV risk.(4)</p> <p>The National Lipid Association (NLA) released an advisory statement saying their position for high-risk and very-high-risk patients with TG 135-499 mg/dL on high-intensity or maximally tolerated statin therapy (±ezetimibe), treatment with icosapent ethyl is recommended for ASCVD risk reduction (evidence rating: class I; evidence level: B-R [strong]). The NLA participated in the development of the 2018 American Heart Association/American College of Cardiology/Multisociety Guideline on the Management of Blood Cholesterol, which reaffirmed that lifestyle changes and statin treatment are therapeutic cornerstones for atherosclerotic cardiovascular disease (ASCVD) risk reduction. It updated prior recommendations to incorporate newer data demonstrating ASCVD risk reduction with ezetimibe and proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitors as adjuncts to statin therapy for patients at high and very-high ASCVD risk. The 2018 Guideline was finalized shortly before full results were available from the REDUCE-IT trial. REDUCE-IT served as the primary basis for the NLA's review of evidence for the use of icosapent ethyl for ASCVD risk reduction.(6)</p>
Safety	Vascepa is contraindicated in patients with known hypersensitivity (e.g., anaphylactic reaction) to Vascepa or any of its components.(1)

PRIOR AUTHORIZATION CLINICAL CRITERIA FOR APPROVAL

Module	Clinical Criteria for Approval
	<p>Initial Evaluation</p> <p>Target Agent(s) will be approved when ALL of the following are met:</p> <ol style="list-style-type: none"> 1. ONE of the following: <ol style="list-style-type: none"> A. The patient has a pre-treatment triglyceride (TG) level of greater than or equal to 500 mg/dL OR B. The patient is using the requested agent to reduce the risk of myocardial infarction, stroke, coronary revascularization, or unstable angina requiring hospitalization AND ALL of the following: <ol style="list-style-type: none"> 1. ONE of the following: <ol style="list-style-type: none"> A. The patient is on maximally tolerated statin therapy OR B. The patient has an intolerance or hypersensitivity to statin therapy OR C. The patient has an FDA labeled contraindication to ALL statins AND 2. The patient's triglyceride (TG) level is greater than or equal to 135 mg/dL AND 3. ONE of the following: <ol style="list-style-type: none"> A. The patient has established cardiovascular disease OR B. The patient has diabetes mellitus AND 2 or more additional risk factors for cardiovascular disease (e.g., hypertension, premature family history, chronic kidney disease) OR C. The patient has another FDA approved indication for the requested agent and route of administration OR D. The patient has another indication that is supported in compendia for the requested agent and route of administration AND 2. If the patient has an FDA approved indication, then ONE of the following: <ol style="list-style-type: none"> A. The patient's age is within FDA labeling for the requested indication for the requested agent OR B. The prescriber has provided information in support of using the requested agent for the patient's age for the requested indication AND 3. The patient does NOT have any FDA labeled contraindications to the requested agent <p>Compendia Allowed: CMS approved compendia</p> <p>Length of Approval: 12 months</p> <p>NOTE: If Quantity Limit applies, please refer to Quantity Limit Criteria.</p> <p>Renewal Evaluation</p> <p>Target Agent(s) will be approved when ALL of the following are met:</p> <ol style="list-style-type: none"> 1. The patient has been previously approved for the requested agent through the plan's Prior Authorization process AND 2. The patient has had clinical benefit with the requested agent AND 3. The patient does NOT have any FDA labeled contraindications to the requested agent <p>Length of Approval: 12 months</p> <p>NOTE: If Quantity Limit applies, please refer to Quantity Limit Criteria.</p>

QUANTITY LIMIT CLINICAL CRITERIA FOR APPROVAL

Module	Clinical Criteria for Approval
QL with PA	<p>Quantity Limit for the Target Agent(s) will be approved when ONE of the following is met:</p> <ol style="list-style-type: none"> 1. The requested quantity (dose) does NOT exceed the program quantity limit OR 2. ALL of the following: <ol style="list-style-type: none"> A. The requested quantity (dose) exceeds the program quantity limit AND B. The requested quantity (dose) does NOT exceed the maximum FDA labeled dose for the requested indication AND C. The requested quantity (dose) cannot be achieved with a lower quantity of a higher strength that does not exceed the program quantity limit OR 3. ALL of the following: <ol style="list-style-type: none"> A. The requested quantity (dose) exceeds the program quantity limit AND B. The requested quantity (dose) exceeds the maximum FDA labeled dose for the requested indication AND C. The prescriber has provided information in support of therapy with a higher dose for the requested indication <p>Length of Approval: 12 months</p>
